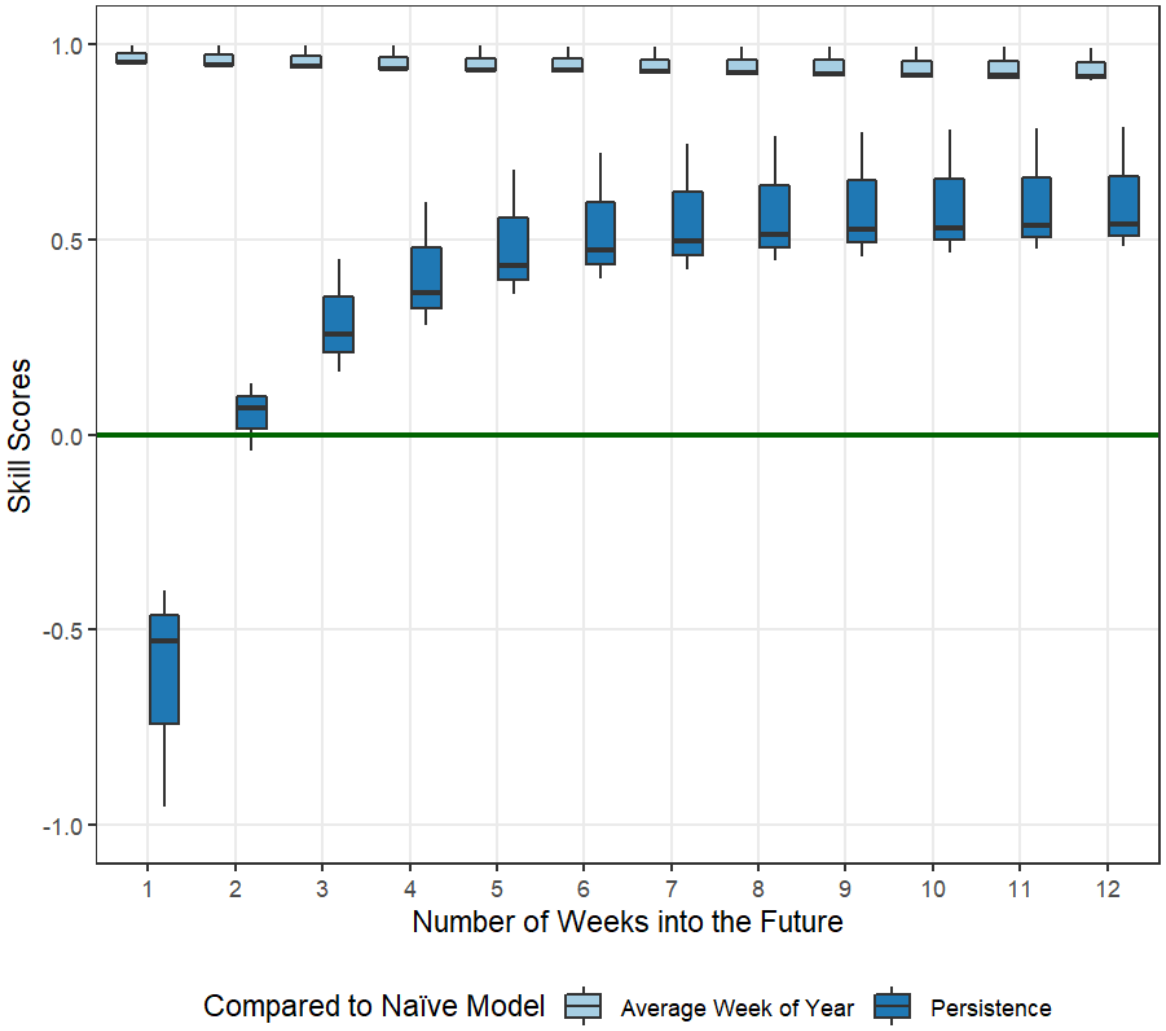
Demonstration Model Validation for Malaria Forecasting
Plasmodium vivax
07 January 2018 - 30 December 2018

EPIDEMIA Team

June 26, 2020

1 Skill Scores Summaries



Skill scores show the improvement (with values greater than 0) of the forecast model (gaussian()) over simple naive models. There are three accuracy statistics used: Mean Absolute Error (MAE), Root Mean Squared Error (RMSE), an a R2 (variance explained). These statistics are compared against the naive models to give the skill scores. The boxplot shows the concordance of skill among the three statistics. Higher values (0 to 1) indicate the greater skill of the forecast models over the simple naive models.

The x-axis is the number of weeks being forecasted into the future. The validation was run with the assumption that there is a reporting lag of 0 weeks.

4 Accuracy Statistics

4.1 Overall Model

Week Ahead	MAE	RMSE	R2
1	1.9	2.9	0.98
2	2.1	3.2	0.97
3	2.3	3.6	0.96
4	2.5	3.8	0.96
5	2.6	4.1	0.95
6	2.7	4.3	0.95
7	2.9	4.4	0.94
8	3.0	4.6	0.94
9	3.1	4.8	0.93
10	3.2	5.0	0.92
11	3.3	5.2	0.92
12	3.4	5.4	0.91

This table contains the raw accuracy statistic values for the forecast model overall for each week forecast into the future. There are three accuracy statistics used: Mean Absolute Error (MAE), Root Mean Squared Error (RMSE), an a R2 (variance explained). The validation was run with the assumption that there is a reporting lag of 0 weeks.

5 Week-ahead Graphs

These graphs show the observed case counts and each of the week-ahead predictions as a series (i.e. all one-week ahead predictions are a series, all two-week, etc.) for the forecast model ((gaussian())). These graphs can be used to visualize how the predictions are behaving n-number of weeks ahead of the target forecast week.
